

# User command Specification

Here is a simple writeup for user functions for a hubsoft, this simple and crude documentation was created upon the request of DJ\_Offset the document is made by Toast and is considered by no means a final solution this shows the basic commands that users expects in a hubsoft if any command is missing add them to the topic thread.

+help - Displays a list of all commands available to you.

*Notes: This list should show user commands only no operator commands.*

+regme - Sends a message to operators requesting help for registration (Verli-style) or sends a message on how to register at the hub (Ynhub-Style)

+regme <pass> - Makes a level 1 registered user account

*Note: A simple command that lets the user register his nick so others cant use it in the hub.*

+myip - Shows you your IP address. (NMDC Style)

+myinf - Shows information like CID, IP (DSHub Style)

*Note: myinf should not contain PID like in DSHub*

+report <user> <reason> -- Report a user to opchat for breaking the rules.

*Note: The report command is holy for Operators since it gives users the option to report bad things in the hub but I want to flag this function for improvement since its often used to spam the hub also perhaps a simple captha would be in order for anyone wishing to use the function.*

+rules

this should read from a text files set able rules by the user.
